

POCKETPLOT UNIVERSE

# Create. Roleplay. Explore.

Premium storytelling for adults - 18+

---

Pitch deck - v23

# A premium storytelling platform for adults.

## A creative writing studio

Generate original branching stories with consistent scene art. Every story is procedurally assembled from in-house word pools -- no two stories are alike.

Choose from 16 genres, set the tone, describe your character and objective -- the engine composes a full branching world with scene-by-scene illustrations.

## A social storytelling network

Share stories via QR code or short link. Readers can play through (game mode) or read through (manga mode) -- no account required.

Public profiles, likes, follow graph, leaderboards. Creators see views, plays, completions, and words written for every story.

*"A world the user can actually play in -- not a button-click visual novel."*

WHO IS IT FOR?

# Three audiences, one platform.

## Writing

### Writers & worldbuilders

Outline a world, pick a tone, and the engine generates a full branching narrative. Scene art generated to match. Export to EPUB, PDF, or share a playable link.

## Tabletop

### Roleplayers & GMs

Bring your own AI engine (BYOB). Run campaigns, share worlds as game links. Players can play through with their own choices -- no sign-up needed.

## Reader

### Readers & players

Discover public stories. Play them as visual novels or read them as manga-style pages. Like, follow, and track your reading stats.

# Three things that make PocketPlot different.

## 01

### Branching-first

Every world is a graph, not a list. Each scene has 2-3 choices that branch the story. The same world can be played hundreds of times with different paths.

## 02

### BYOB

Bring Your Own Brain. Connect your own OpenAI-compatible LLM (OpenAI, Anthropic via proxy, OpenRouter, Ollama). The platform handles content moderation on the response side.

## 03

### Consistent scene art

Every scene gets a procedurally-composed SVG illustration matched to the genre, tone, and story state. Visual continuity without paying per image.

# Every story, two surfaces.

## PLAY MODE

*Visual novel. Choices. Branching.*

- Numbered choice buttons - Each choice advances the player session - Progress bar (chapter X of Y) - Completion banner when finished - 'See world map' link - Stored as a session cookie + DB row - Player path tracked: [ep1, ep3, ep5, ...]

## READ MODE

*Manga / storybook. Read-only.*

- One page per episode - Art panel + italic narration - 1-2 speech bubbles (speaker inferred) - Page-flip CSS animation - Keyboard nav: left/right arrows - Cream parchment background - No sign-up needed for the player

# Scenes as nodes. Choices as edges.

---

## A Minecraft-style foundation

- Each scene = one node on a 2D map
- Visited scenes glow with amber light
- Click a node to enter that scene
- Linear graph synthesis when no author data
- Custom placement in v24 (scene\_nodes\_json)
- Foundation for full Minecraft-style navigation

# Built for sharing, built for retention.

## Engagement loop

- Like a story (1-tap, persisted)
- Per-world stats: views, plays, completions, likes, words
- Continue-the-story prompt on every episode
- Chapter progress bar
- Milestone emails (1st story, 10 words, 100, 1k, 10k)
- Weekly summary email for Pro + Creator

## Community

- Public profile at /u/<username>
- 3 featured stories per profile
- Follow graph (followers + following)
- Notifications: new follower, story shared with you
- Share token system (one world, many links)
- QR code generation for every share link

# Take it with you. In any format.

## PDF

### PDF

Cover page + all chapters in one document. Use the existing pdf\_gen.py pipeline.

## Reader

### EPUB

Standard e-reader format. Cover + TOC + per-chapter XHTML.  
Hand-rolled, no library dep.

## ZIP

### Bulk ZIP

manifest.json + README + one .md per episode  
(chapters/00N-chapter-N.md).

## Link

### Share link

A short URL + QR code. The recipient plays or reads in their browser -- no sign-up.

# The path to a Minecraft-style world.

v22 OK

Tech-Victorian visual identity + brand mark

v23 OK

Engagement, community, exports, PWA, READ mode

v24

Inventory, build mode, real node-graph editor,  
VAPID push delivery, custom world-map coordinates

v25

Real-time multiplayer, native iOS/Android shells,  
AI-generated manga art (v.s. our SVG)

# Single-file Flask. No vendor lock-in.

## TECH STACK

Backend: Python 3.13 + Flask (single app.py, ~9,000 lines) + APScheduler + sqlite3

Frontend: server-rendered HTML + inline CSS + Jinja2 templates (no SPA, no build step)

Storage: SQLite (single file) + outbox-folder email + JSON column metadata

AI:     procedural generator (default) + OpenAI-compatible BYOB (Creator tier)

Mobile:   PWA (manifest + service worker) -> install on iOS/Android home screen

## GET INVOLVED

pocketplot.app - Try the public /seed prompt generator - Read the open HANDOFF.md
