SECTION 1 / OVERVIEW

What is PocketPlot?

A premium storytelling platform where adults create, share, and explore branching interactive worlds.

A creative writing studio

Generate original branching stories with consistent scene art. Every story is procedurally assembled from in-house word pools - no two stories are alike.

Choose from 16 genres, set the tone, describe your character - the engine composes a full branching world with scene-by-scene illustrations.

A social storytelling network

Share stories via QR code or short link. Readers can play through (game mode) or read through (manga mode) - no account required.

Public profiles, likes, follow graph, leaderboards. Creators see views, plays, completions, and words written for every story.

"A world the user can actually play in - not a button-click visual novel."

SECTION 2 / AUDIENCE

Who is it for?

01

Writers & worldbuilders

Outline a world, pick a tone, and the engine generates a full branching narrative. Scene art generated to match. Export to EPUB, PDF, or share a playable link.

02

Roleplayers & GMs

Bring your own AI engine (BYOB). Run campaigns, share worlds as game links. Players can play through with their own choices - no sign-up needed.

03

Readers & players

Discover public stories. Play them as visual novels or read them as manga-style pages. Like, follow, and track your reading stats.

SECTION 3 / DIFFERENTIATORS

Three things that make PocketPlot different

01

Branching-first

Every world is a graph, not a list. Each scene has 2-3 choices that branch the story. The same world can be played hundreds of times with different paths.

02

BYOB - Bring Your Own Brain

Connect your own OpenAI-compatible LLM (OpenAI, Anthropic via proxy, OpenRouter, Ollama). The platform handles content moderation on the response side.

03

Consistent scene art

Every scene gets a procedurally-composed SVG illustration matched to the genre, tone, and story state. Visual continuity without paying per image.

SECTION 4 / GAME MODES

Every story, two surfaces

One world. Two ways to experience it. The creator publishes both.

PLAY MODE

Visual novel. Choices. Branching.

- Numbered choice buttons advance the player session
- Progress bar shows chapter X of Y
- Completion banner when the story is finished
- See-world-map link for the visual navigation view
- Session stored as cookie plus a database row
- Player path tracked as a list of visited episodes

READ MODE

Manga / storybook. Read-only.

- One page per episode - manga-style panels
- Art panel plus italic narration blockquote
- One to two speech bubbles per page
- Page-flip CSS animation between pages
- Keyboard navigation with left and right arrows
- Cream parchment background, brass borders

SECTION 5 / WORLD MAP

Scenes as nodes. Choices as edges.

A Minecraft-style foundation

- Each scene is one node on a 2D map
- Visited scenes pulse with amber light
- Click a node to enter that scene
- Linear graph synthesis when no author data exists
- Custom placement in v24 (scene_nodes_json column)
- Foundation for full Minecraft-style exploration

SECTION 6 / ENGAGEMENT & COMMUNITY

Built for sharing. Built for retention.

Engagement loop

- One-tap like on any story, persisted
- Per-world stats: views, plays, completions, likes, words
- Continue-the-story prompt on every episode
- Chapter progress bar on every screen
- Milestone emails: first story, 10 words, 100, 1k, 10k
- Weekly summary email for Pro and Creator tiers

Community

- Public profile at /u/<username>
- Up to 3 featured stories per profile
- Follow graph: followers and following
- Notifications for new follower or story share
- Share token system: one world, many links
- QR code generation for every share link

SECTION 7 / EXPORTS

Take it with you. In any format.

01

PDF

Cover page plus all chapters in one document. Uses the existing pdf_gen.py pipeline.

02

EPUB

Standard e-reader format. Cover, TOC, and per-chapter XHTML. Hand-rolled, no library dependency.

03

Bulk ZIP

manifest.json plus README plus one .md per episode in chapters/. Drop into any static site.

04

Share link

A short URL plus QR code. The recipient plays or reads in their browser with no sign-up.

SECTION 8 / ROADMAP

The path to a Minecraft-style world

v22

DONE

Tech-Victorian visual identity + brand mark

v23

DONE

Engagement, community, exports, PWA, READ mode

v24

NEXT

Inventory, build mode, real node-graph editor, VAPID push delivery, custom world-map coordinates

v25

FUTURE

Real-time multiplayer, native iOS/Android shells, AI-generated manga art (vs. our SVG)

SECTION 9 / TECH STACK

Single-file Flask. No vendor lock-in.

Backend	Python 3.13 + Flask (single app.py, ~9000 lines) + APScheduler + sqlite3
Frontend	Server-rendered HTML + inline CSS + Jinja2 templates (no SPA, no build step)
Storage	SQLite (single file) + outbox-folder email + JSON column metadata
AI	Procedural generator (default) + OpenAI-compatible BYOB (Creator tier)
Mobile	PWA (manifest + service worker) -> installable on iOS/Android home screens

"A world the user can actually play in - not a button-click visual novel."
